ABSTACT:

The strategy for further development of the Republic of Uzbekistan attaches great importance to economic diversification, industrialization and the role of high-tech industries. We can see big changes in this direction over the past two years. According to the State statistics Committee of the Republic of Uzbekistan, in 2019, the share of industry in GDP was 26.5% (22.2% in 2018). The annual rate of industrial production was 114.4% .

INTRODUCTION

The volume of products produced by industrial enterprises in January-December 2019 amounted to 175.4 trillion. sum or 76.6% of the total industrial output.

The share of high-tech industry in the structure of the manufacturing industry is 1.6% (in January - December 2019-1.9%), medium - high-tech-29.7% (21.7%), medium-low-tech - 29.8% (27.0%) and low - tech-38.9% (49.4%).

Medium-high-tech production has made a significant contribution to the growth of industrial production in the country, with a growth rate of 9.6% compared to the corresponding period of 2019, the growth rate was 138.8%.

MAIN PART

As a result of a sharp increase in the number of small businesses in industrial production, the volume of industrial production increased by 10.2% compared to the same period last year, and the share of small businesses in total industrial production was 34.7%. The volume of industrial production amounted to 79457.7 billion dollars. soums (34.7% of total industrial production) or 110.2% by January-December 2018.

Stimulating and expanding the production of finished products affected the growth of consumer goods production in January-December 2019 (by 115.9%), and its share in total industrial production was 36.8%.

The implementation of the program of localization of production of finished products, components and materials also had an impact on the development of industrial production in the country. Products worth 457.8 million were produced. Sums. Localized products worth US dollars were exported and 1,092 new jobs were created.

The data show that the role of industry in the development of our country is invaluable. Individual industries play an important role, especially in the production of consumer goods, filling the domestic consumer

market and the production of import-substituting products. These include the woodworking and furniture industries.

The furniture and woodworking industry of the Republic of Uzbekistan is one of the fastest growing industries in the country. If in previous years 65-70% of the domestic furniture market was filled with products from foreign manufacturers, today more than 90% of demand is provided by high-quality furniture products produced in our country. The overall analysis shows that the city of Tashkent and five regions of the country are leaders in furniture production, namely Tashkent, Ferghana, Samarkand, Namangan and Kashkadarya regions. These regions account for 80% of furniture production. Recently, furniture production has also been developing in the Jizzakh and Navoi regions.

Furniture manufacturers play an important role in meeting the daily needs of the population of our country, creating decent living conditions in housing. Furniture is necessary for any new premises or neglected social object, which means that as the economy develops, the demand for furniture products will grow. As an example, here are the figures for 2019.

Meeting the demand for furniture products, on the one hand, requires an increase in the number and scale of furniture manufacturers, on the other - leads to the rapid development of modern market mechanisms in this area.

The fact that furniture manufacturers offer new models can be attributed to the variability of the furniture product market. Fashion takes one of the main places in the demand for furniture. At any stage of society's development, the home environment is relevant. As a result, the demand and compositional forms in the furniture market should also be more modern than in other markets.

Variability of production technologies. This feature largely depends on the content of operations, such as ensuring the functionality of furniture, the need to process raw materials, design, creation, transportation and installation of furniture. For example, the departure of modern furniture from standardization is due to the fact that each apartment has a unique living environment. As a result, there is a transition to individual production technologies.

Local furniture products meet the needs of social facilities for special furniture. The creation of a large number of small businesses in this market has created a strong competitive environment in the industry, which in turn leads to the introduction of new advanced technologies in production, constant modernization of enterprises. The range of manufactured furniture does not lag behind other developed markets, and the quality of products is approaching international standards. Furniture design develops in accordance with the trends of the most modern furniture market. Wherever new designer furniture appears in any corner of the globe, our entrepreneurs can quickly learn its technologies. As a result of stimulating localization programs, new types of raw materials and goods are being created in the industry. Of course, state support measures for the industry played an important role in achieving these results. It is known that the furniture industry requires a large amount of wood raw materials, and in our country the opportunities to grow high-quality wood in this volume are limited. More than 60% of wood raw materials used in industry are imported. In this regard, the President and the Government have taken measures to support the furniture industry in the following areas:

- Optimization of customs duties and taxes on imports of basic raw materials and materials used in the production of furniture products;

- Application of tax incentives and preferences for producers of consumer goods made of wood;

- Simplification of business conditions for entrepreneurs in the furniture industry;

- Creating the necessary conditions, financial and technical assistance for individual entrepreneurs and family businesses in the industry.

At the same time, there are certain limits to state support for business, which means that entrepreneurs must also take advantage of the opportunities provided and introduce the most advanced scientific achievements into production. Today, given that the application of the concept of marketing in the science of economic management is highly effective for enterprises, its application in enterprises and economic societies is of great importance.
