ABSTRACT

Social Coronization is a process of socialization with Corona by community. Its a positive social term like hard community, growth of immunity against Corona. Though hard community and immunity against Corona are likely a medical term but social coronisation is purely social in nature, when people become easy with corona virus infection and never creating any panic or terror as before in early stage of pandemic situation, when there were some dominating rules; as social distancing, disruption of free communication, lockdown, community ignoracy and stigmatization, more hatredness to corona affected patient and even block their family to interact with neighbours. This Corona pandemic not only created medical crisis but also created economic, religious, political, psychological, and social crisis. This pandemic situation not only created fear for infected people but also created fear for all the members of family, neighbours and community, those who are going outside for earning or for some other causes. After 8 to 9 months of Corona period most of the peoples become socialize with various kinds of prevention norms and regulation of corona virus as masks wearing, using sanitizer and maintaining social distancing and after all interacting spontaneously with inside and outside without any antihuman fear of Corona patients and Corona virus infection. At that moment our Indian society may be urban or rural, no one deprive other, mainly for the social coronisation, though till now corona virus is existing among us, yet for the fear of Corona infection, we are not deprived and stigmatized other. So this well acceptance and treat people as human being is very positive for healthy Society and social system also. Each and every individuals and also every members of society have to judge people as human being but not as corona patient and we have to stretch our helping hand to promote the process of social coronisation.

Key Words : *Coronization, Lockdown, Well-acceptance, Social distancing, Communication.*

INTRODUCTION

Social Coronation is a process of socialization of Corona. Corona infection diseases has appeared as a global catastrophe and become pandemic all over the world. Before Corona infection diseases, where has arisen Ebola virus, plague etc. That plague virus was more harmful than corona, yet plague could not spread all over the world. Because at that time communication and transportation was not so strong, but at this moment by the bliss of globalization world communication and transportation system become very developed, that's why the process of migration and immigration become frequent. So this frequent migration of people from here to there is one of the most fundamental factors of spreading corona. Corona infection diseases have spread all over the world, though Corona infection diseases was spreading very quickly from China to Europe, Europe to Asia and taken a form of Pandemic. World health organization has announced for lock down to check corona infection in society to maintain social distancing, hand sanitizing etc. One of the most fundamental measures to prevent corona virus infection that's why WHO has declared that, social distancing is the most vital method to check corona infection in our community. Without social distancing hand sanitizing musk wearing and others measures are also very important to check corona infection. So before going to discuss about Coronization at first we have to understand what is Corona ? and what is socialization? Corona is a virus arise from that manifested in the body of bats then it has transferred to the human body in China, then it is spread out Europe,

America, India and another countries of the world. It is a very low morbidity virus, yet corona infection was increasing gradually in an alarming rate and also spreading very fast all over the world by the bliss of globalization.

CORONIZATION

Mainly in late 20th century by the process of Structural Adjustment Programme (SAP) all over the world liberalization, privatization and globalization become started very frequently. So by the bliss of globalization, Communication and transportation system become very developed where people communicate very easily one country to other country, people move from here to there without any obstacle by the various means of communication system railway and airways. Mainly migration an immigration process is one of the vital factors to spread Corona virus infection very fastly. Though immediately World Health Organization has given instruction to start several measures to control corona infection, as to keep lockdown the transportation and communication, educational institutions, religious institutions and any kind of crowding to maintain social distancing. This Corona preventing method of social distancing purely oppose to social interaction and which is not conforming various patterns of interaction as well as social relationship, which is the core element of society. Society is not only the group of people but some interaction processes are very vital in our everyday life, like-cooperation, competition, conflict, acculturation, assimilation and accommodation.

Yes Method of lockdown and the practice of social distancing have created a stagnation on normal social life, that's why people avoid to interact verbally and non- verbally with their neighbour, community and society. So, a strong deprivation, ignoracy, negligency and stigmatization were prevailing in post pandemic corona period of all over the world. A normal social interaction process becomes distorted, this communication distortion have created pathological and hardship situation on our normal social life. With this social hardship and stigmatize situation peoples also have faced strong economical problem, health problem, religious problem, educational problem etc. In post-pandemic situation, all over the world educational institutions and teaching-learning process become stop. Also corona pandemic have created a miserable condition in the life of labour class people, those who are unorganized and migrated, never they have faced only economical crisis but they become frustrated totally and wanted to return to their native home but not getting any scope and without any communication and transportation they have started walking. In the way of walking to their destination, they have to faced the ignoracy, negligency and hatredness by the local people, police and politician. So, a strong deprivation was prevailing on their life, but at least they were walking thousands of miles by day after day without eating and drinking water. The lockdown have ceased teaching learning process of each and every educational institution like primary secondary school college and university. So students have to face an unexpected situation ,because students were unable to contact with their friends and teachers. Though after 8 months of Post covid situation people become easy with this hard condition.

STIGMATIZATION

The Global corona catastrophe has created a social stigma on normal social life. That corona infection disease have not only created fear and terror among people but also created stigmatisation among people. This type of social phenomena is not normal ,its a pathological situation .Though gradually people become easy with this corona catastrophic situation as well as socialize with this fact that had taken millions of human life as tool. After nine or ten month of post Corona period people become socialise with this corona virus. Because people become fadeup, irritative with this fearfulness situation of corona ,now people are thinking about their family,

neighbour, community and society, also people are returning to normal social life as before. Villagers become more aware about the low morbidity nature and consequences of corona infection disease. So at this moment nobody hatred others by the causes infection, most of the peoples are well known that already they have become corona infected, and automatically they will be cure by drinking hot water and eating healthy food. Now people are not behaving rough, not depriving others and stigmatising others people, rather than well acceptance, cooperation and mutual help are beginning as before in pre-corona social situation.

COVID ORIENTED SOCIAL PROBLEM

Community is a group of people living in a certain geographical territory and having common sentiments, Community is a very vital topic of sociology. Sociology is the scientific study of society, society is formed by the combination of some communities - complex pattern of social relationship. Without any community no society will be establish. So community is the soul of our societal cooperative relationship. Each and every strong cooperation, competition, conflict, accommodation, assimilation and acculturation are happening by the chemistry of community relationship. During the post covid-19 situation, a health protective measures has taken by our Government as lockdown to maintain social distancing. These two pathological measures are inhuman and unsocial, that's why most of the people are not able to maintain properly. This preventive measures of lockdown and social distancing have created the distortion among people's everyday social and normal activities. All the section or classes are suffering by this distance maintaining lockdown. Higher classes or economically rich, those who are belong to higher class and not suffering by economical crisis, though other problems they have to face gradually; as-

- (a) to visit doctor for other diseases
- (b) to purchase daily using commodity
- (c) to meet with relatives,
- (d) to travel another place, etc.

Lower class or economical poor and labourer, those who have faced very serious problems because most of the poor peoples are daily labourers. They have lost their temporary job mainly workers of unorganized sector, house maid, rickshaw pullar, hawker etc. Some Government help has been given that was not sufficient. For their subsistence they have to go to outside of home for searching job and have to face police and got bitten. Migrant labourers have to face to various kinds of problem and stigmatize by native people and also from the people of the working place. We have seen their tragedy and misery. How they have lost their life in the way of returning to native home from working area. Small and micro entrepreneur and vendor; those who has small business, as tea stall, vegetables, fish, meat shop, all have faced crisis by lockdown.

POST COVID SITUATION

Post Covid problems has created a strong difficulties in our social life. Because world health organization declared some preventive methods to control Corona infection disease as lockdown. The method lockdown is a process to create disruption on the process of social interaction of individual following these instructions of WHO , our India Government announced suddenly to start lockdown and to implement lockdown properly in our country. But they sudden implementation of lockdown have created economical problem educational problem, social problem in our life. Because, all the section of people have faced psychological problems they never was agreed with this lockdown by which people will not be able to go to outside from their home because they never this situation before, people are not practices. So some poor people who have know way of subsistence without daily earning they have to come out from home breaking the norms of lockdown, that's why

several most of the time they have to face the torture of police even given toll of their life by the hand of police. Basically Migrant laborers have faced very critical problematic situations due to sudden announcement of lockdown of government's negligence for their returning. No government have provided any transportation for them through which they can able to return to their native home, so for government negligency and jobless condition were prevail on them as curse. Without getting any help assistance from government and non government institutions they become frustrated.

Corona virus infection disease has appeared as a Catastrophe and to take in a form of pandemic, because, due to the positive consequences of globalisation corona infection has spread all over the globe, that's why corona infection has taken the form of global catastrophe. So at this moment rapid awareness generation programme have to start in our community, group, club and in Samities, by identifying various persons and pockets of community. We know in each and every community where has an important persons in urban and rural area also. In urban areas, where are teachers, doctors, businessman, corporation workers, ward councillors etc. And in rural area where area where rural area where has Panchayat members, teacher, service holders, RMP, LIC agent etc. who are rendering their service very spontaneously for social development as well as for the welfare of their own community. We have to give more important to involve those persons and awake them, then all the community will be aware and able to maintain social norms as handwashing, social distancing, sanitizing and mask wearing mandatorily mainly to combat corona.

CONCLUSION

In the concluding part we can say that after 9th months pandemic and the terror of Corona infection become easy and use to with society, people become adjusted with the pathological conditions of corona pandemic. Now no stagnation are prevailing as before, on stigmatisation are existing among people, no hatredness are practicing by people. Because people have learnt that coronavirus infection is not so dangerous and harmful for those who have proper immunity power, they will overcome easily the Corona infection disease. So this "Social Coronisation" has broken all the barriers and obstacle of social inter action and communication that has created by lockdown and social distancing. We hope that after two or three month, this corona infection diseases will be go away, that means after getting coronavirus vaccine this disease will be vanished from our goal. If corona virus will stay with us as other virus forever, yet we never be judge people by the aspect of covid but by the aspect of human value.
